The views and opinions of authors expressed herein do not necessarily state or reflect those of the United States Government or the Air Force, and shall not be used for advertising or product endorsement purposes.

This report and those involved in its preparation do not endorse any product, process, or company stated herein. Use of these means by anyone does not imply certification by the Air Force CALS Test Network (AFCTN).

Contents

1. Introduction

1.1 Background

The Department of Defense (DoD) Air Force Continuous Acquisition and Life-cycle Support (CALS) Test Network (AFCTN) is conducting tests of the military standard for the Automated Interchange of Technical Information, MIL-STD-1804A, and its companion suite of military specifications. The AFCTN is a DoD sponsored confederation of voluntary participants from industry and the government managed by the Electronic Systems Center (ESC).

The primary objective of the AFCTN is to evaluate the effectiveness of the CALS standards for technical data interchange and to demonstrate the technical capabilities and categories of tests are performed to evaluate the standards; formal and informal.

Formal tests are large and comprehensive, which follow a written test plan, require specific authorization from the DoD, and may take months to prepare, execute, and report.

Informal tests are quick and short, used by the AFCTN technical staff, to broaden the testing base. They include representative samples of the many systems and applications used by AFCTN participants. They also allow the AFCTN staff to gain feedback from many industry and government interpretations of the standards, to increase the base of participation in the CALS initiative, and respond to the many requests for help that come from participants. Participants take part voluntarily, benefit by receiving an evaluation of their latest implementation (interpretation) of the standards, interact with the AFCTN technical staff, gain experience using the standards, and develop increased confidence in them. The results of informal tests are reported in Quick Short Test Reports (QSTRs) that briefly summarize the standard(s) tested, the hardware and software used, the nature of the test, and the results.

1.2 Purpose

The purpose of the informal test, reported in this QSTR, was to analyze IBM SID Boulder's interpretation and use of the CALS standards in transferring technical publication data. IBM SID used its CALS Technical Data Interchange System to produce data, in accordance with the standards, and delivered it to the AFCTN technical staff on a 9-track magnetic tape.

2. Test Parameters

Test Plan: AFCTB 93-070

Date of
Evaluation: 12 July 1993

Evaluator: George Elwood
                              Air Force CALS Test Bed
                              DET 2 HQ ESC/AV-2P
                              4027 Colonel Glenn Hwy.
                              Suite 300
                              Dayton OH 45431-1672

MIL-M-28001A
MIL-R-28002A
MIL-D-28003

3. 1840A Analysis

3.1 External Packaging

The tape arrived at the Air Force CALS Test Bed (AFCTB) enclosed in a box in accordance with ASTM D 3951. The exterior of the box was marked with a magnetic tape warning label, as required by MIL-STD-1840A, para. 5.3.1.3.

The tape was enclosed in barrier sheet material as required by MIL-STD-1840A, para. 5.3.1.2. Inspection of the tape reel showed a label indicating the recording density, as required by MIL-STD-1840A, para. 5.3.1. Enclosed in the box was a packing list showing all files recorded on the tape.

3.2 Transmission Envelope

The 9-track tape received by the AFCTB contained MIL-STD-1840A files. The files were named per the standard conventions.

3.2.1 Tape Formats

The tape was run through the AFCTN *Tapetool v1.2.10* utility. No errors were encountered while evaluating the contents of the tape labels.

The tape was read using XSoft's *CAPS read1840A* utility without any reported errors.

The tape was read using TI's *Tapetool v1.0.1* without any reported errors.

The physical tape structure meets the CALS MIL-STD-1840A requirements.

3.2.2 Declaration and Header Fields

No error were found in the Document Declaration file and data file headers.

This portion of the tape meets the CALS MIL-STD-1840A requirements.

4. IGES Analysis

The tape contained no Initial Graphics Exchange Specification (IGES) files.

5. SGML Analysis

The tape contained one DTD and Text file. The Text file was over 1Meg and as such could not be parsed by some of the tools available in the AFCTB.

The AFCTB has several parsers available for evaluating submitted DTD and Text files. These tools are not used to generate a pass/fail but to report how commercially available software can handle the files. These products are used in the development of technical publications and are good indicators of usability. The use of these products is not an endorsement nor an indication of CALS capability. All operations were performed using the default settings unless specified in the report. Changes to DTD or Text files required by each system are not documented in the report.

The Text and DTD files were evaluated using the Exoterica *Validator exl* parser. No errors were reported, but 27 warnings were issued during the evaluation.

Per Ina Dickinson of IBM SID Boulder, "Our product used MIL-M-28001 as specified contractually with our customer; therefore, testing against 28001A may have caused the warnings."

The Text and DTD files were tested using the Exoterica *XGMLNormalizer* parser with no reported errors.

The Text and DTD files were evaluated using the Public Domain *sgmls* parser with no reported errors.

The SGML files meet the CALS MIL-M-28001A specification.

6. Raster Analysis

The tape contained 167 Raster files. All files were evaluated using the AFCTN *validg4* utility. This program reported that all 167 files meet the CALS MIL-R-28002A specification.

The files were read into the AFCTN *calstb.475* viewing utility. No problems were noted.

The AFCTB has several tools for viewing Raster files. These tools are not used to generate a pass/fail but to report how commercially available software can handle the files. Many of these products are used in the development of technical publications and are good indicators of usability. The use of these products is not an endorsement nor an indication of CALS capability. All operations were performed using the default settings.

The two files were converted using a utility available within the AFCTB without a reported error. The resulting files were read into Island Graphics' *IslandPaint*, displayed and printed in the completed document.

The Raster files were read into Carberry's *CADLeaf* software without a reported error. The images were displayed without a problem.

The files were read into IDA's *IGESView* and *IGESView for Windows* without a reported error. A sample of the files were printed and are included in the Appendix to this report.

The files were read into Inset Systems' *HiJaak for Windows* without a reported error.

The files were converted, using Inset Systems' *HiJaak for DOS*, into an IMG format without a reported error. The resulting files were read into Corel's *Ventura Publisher* and displayed.

The Raster files were converted using Rosetta Technologies'
Prepare without a reported error. The resulting files were
read into Rosetta Technologies' *Preview* and displayed.

The Raster files meet the CALS MIL-R-28002A specification.

7. CGM Analysis

The tape contained no Computer Graphics Metafile (CGM)
files.

8. Conclusions and Recommendations

The physical structure of the tape from IBM SID Boulder meets the CALS MIL-STD-1840A requirements.

The SGML files meet the CALS MIL-M-28001A specification.

The Raster files meet the CALS MIL-R-28002A specification.

The tape meets the CALS MIL-STD-1840A requirements.
